

Just-in-Time and Lean Production Systems

Introductory Quotation

Waste is ‘anything other than the ***minimum*** amount of equipment, materials, parts, space, and worker’s time, which are absolutely essential to ***add value*** to the product.’

JIT/Lean Operations

Good production systems require that managers address three issues that are pervasive and fundamental to operations management: eliminate waste, remove variability, and improve throughput

1. Eliminate Waste

- ◆ **Waste is anything that does not add value from the customer point of view**
- ◆ **Storage, inspection, delay, waiting in queues, and defective products do not add value and are 100% waste**

Ohno's Seven Wastes

- ◆ **Overproduction**
- ◆ **Queues**
- ◆ **Transportation**
- ◆ **Inventory**
- ◆ **Motion**
- ◆ **Overprocessing**
- ◆ **Defective products**

Eliminate Waste

- ◆ **Other resources such as energy, water, and air are often wasted**
- ◆ **Efficient, sustainable production minimizes inputs, reduces waste**
- ◆ **Traditional “housekeeping” has been expanded to the 5 Ss**

The 5 Ss

- ◆ **Sort/segregate** – when in doubt, throw it out
- ◆ **Simplify/straighten** – methods analysis tools
- ◆ **Shine/sweep** – clean daily
- ◆ **Standardize** – remove variations from processes
- ◆ **Sustain/self-discipline** – review work and recognize progress

The 5 Ss

- ◆ **Sort/segregate** – when in doubt, throw it out

- ◆ **Simplify/straighten** methods

- ◆ **Two additional Ss**

- ◆ **Safety** – build in good practices

- ◆ **Support/maintenance** – reduce variability and unplanned downtime

2. Remove Variability

- ◆ **JIT systems require managers to reduce variability caused by both internal and external factors**
- ◆ **Variability is any deviation from the optimum process**
- ◆ **Inventory hides variability**
- ◆ **Less variability results in less waste**

Sources of Variability

- 1. Incomplete or inaccurate drawings or specifications**
- 2. Poor production processes resulting in incorrect quantities, late, or non-conforming units**
- 3. Unknown customer demands**

Sources of Variability

- 1. Incomplete or inaccurate drawings or specifications**
- 2. Poor production processes resulting in incorrect quantities, late, or non-conformance**
- 3. Unknown causes**

Both JIT and inventory reduction are effective tools in identifying causes of variability

3. Improve Throughput

- ◆ **The time it takes to move an order from receipt to delivery**
- ◆ **The time between the arrival of raw materials and the shipping of the finished order is called manufacturing cycle time**
- ◆ **A pull system increases throughput**

Improve Throughput

- ◆ **By pulling material in small lots, inventory cushions are removed, exposing problems and emphasizing continual improvement**
- ◆ **Manufacturing cycle time is reduced**
- ◆ **Push systems dump orders on the downstream stations regardless of the need**

Just-In-Time (JIT)

- ◆ **Powerful strategy for improving operations**
- ◆ **Materials arrive where they are needed when they are needed**
- ◆ **Identifying problems and driving out waste reduces costs and variability and improves throughput**
- ◆ **Requires a meaningful buyer-supplier relationship**

JIT and Competitive Advantage

JIT TECHNIQUES:

| | |
|-------------------------|---------------------------------------------------------------------------------------------------------------------|
| Suppliers: | Few vendors; Supportive supplier relationships; Quality deliveries on time, directly to work areas. |
| Layout: | Work-cells; Group technology; Flexible machinery; Organized workplace; Reduced space for inventory. |
| Inventory: | Small lot sizes; Low setup time; Specialized parts bins |
| Scheduling: | Zero deviation from schedules; Level schedules; Suppliers informed of schedules; Kanban techniques |
| Preventive maintenance: | Scheduled; Daily routine; Operator involvement |
| Quality production: | Statistical process control; Quality suppliers; Quality within the firm |
| Employee empowerment: | Empowered and cross-trained employees; Training support; Few job classifications to ensure flexibility of employees |
| Commitment: | Support of management, employees, and suppliers |

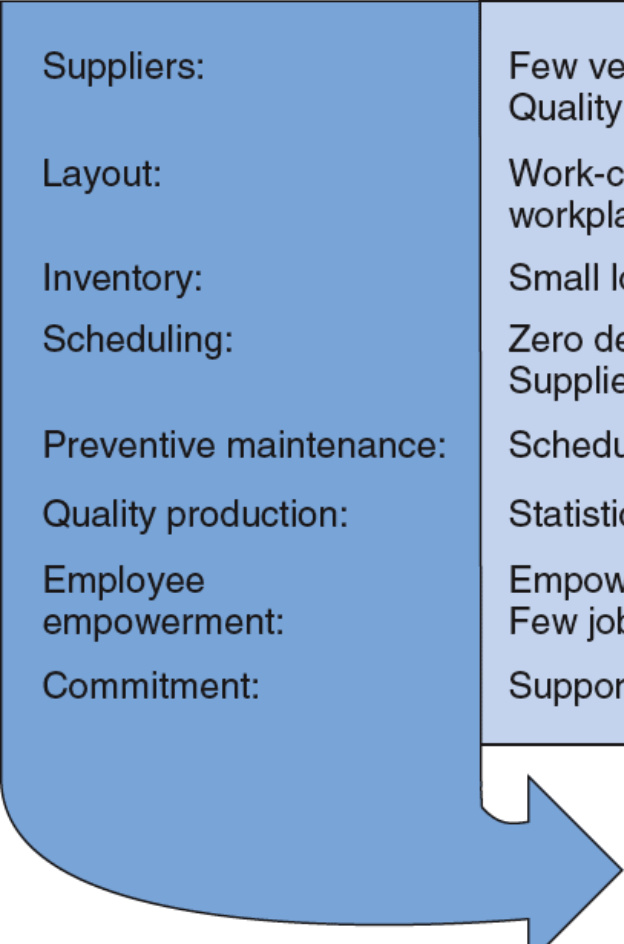

Figure 16.1

JIT and Competitive Advantage

WHICH RESULTS IN:

Rapid throughput frees assets
Quality improvement reduces waste
Cost reduction adds pricing flexibility
Variability reduction
Rework reduction

WHICH WINS ORDERS BY:

Faster response to the customer at lower cost and higher quality—
A Competitive Advantage

JIT Partnerships

- ◆ **JIT partnerships exist when a supplier and purchaser work together to remove waste and drive down costs**

- ◆ **Four goals of JIT partnerships are:**
 - ◆ **Removal of unnecessary activities**
 - ◆ **Removal of in-plant inventory**
 - ◆ **Removal of in-transit inventory**
 - ◆ **Improved quality and reliability**

JIT Partnerships

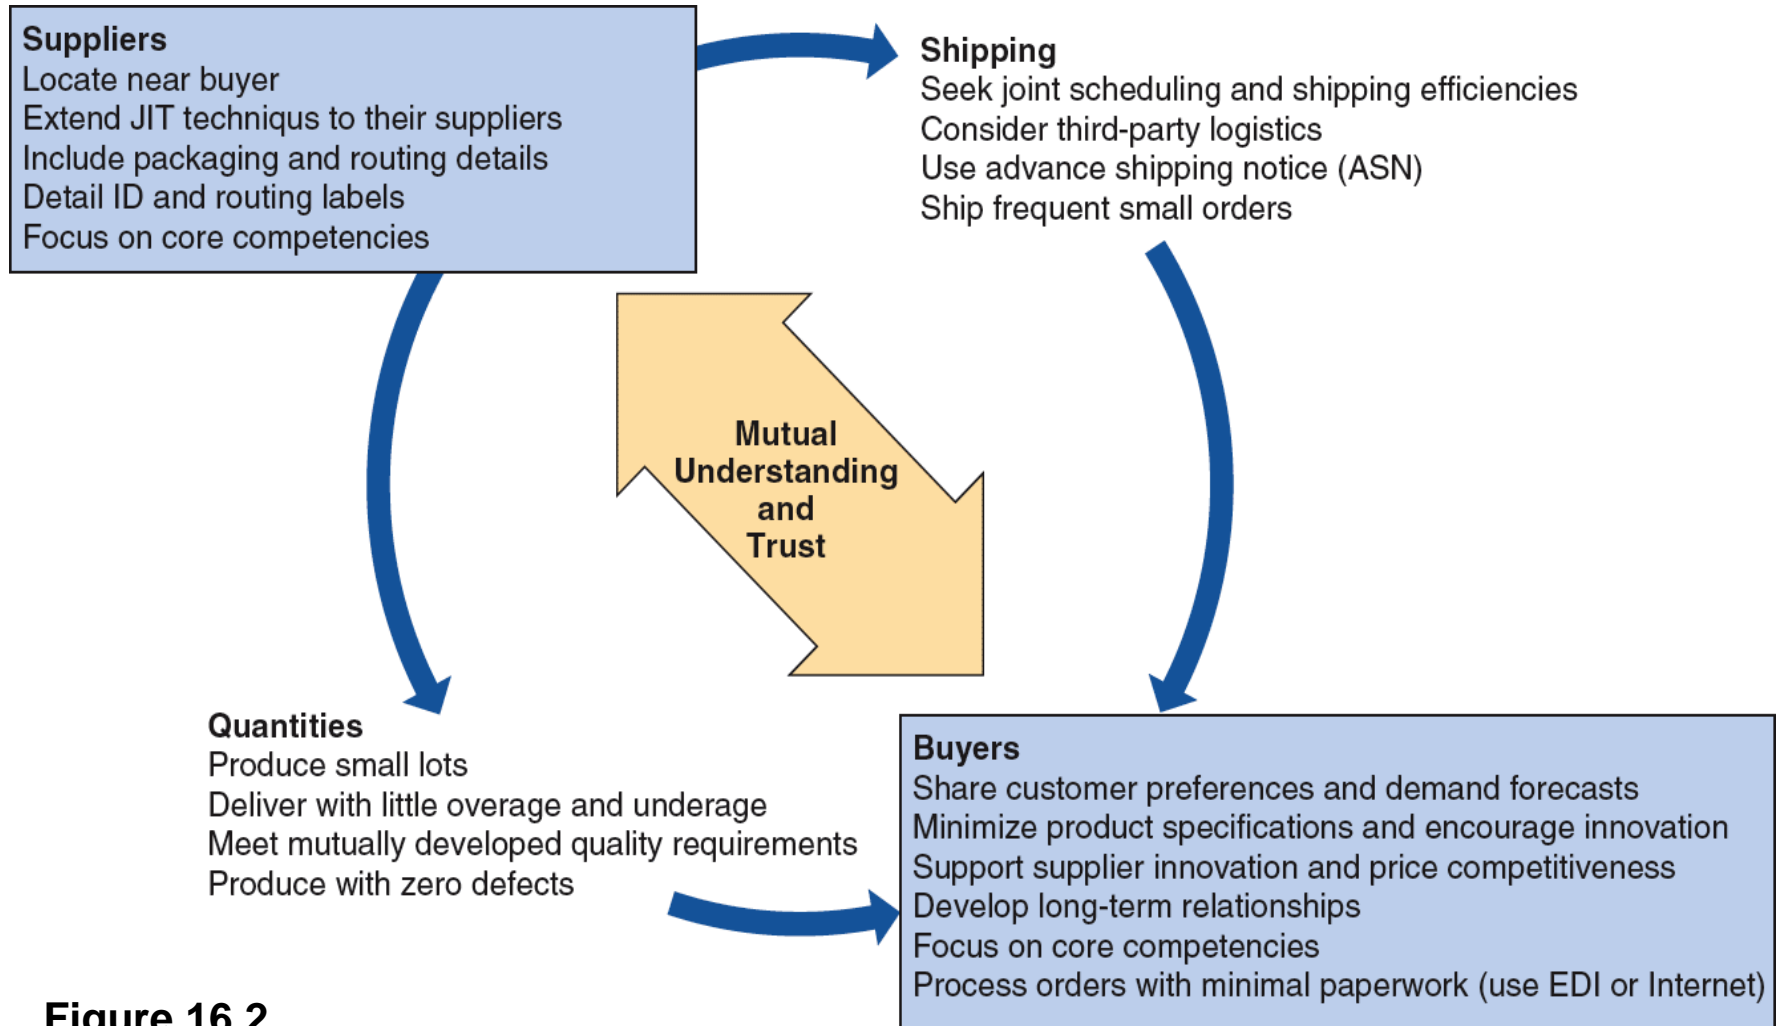

Figure 16.2

JIT Layout

Reduce waste due to movement

JIT Layout Tactics

Build work cells for families of products

Include a large number operations in a small area

Minimize distance

Design little space for inventory

Improve employee communication

Use poka-yoke (fail safe) devices

Build flexible or movable equipment

Cross-train workers to add flexibility

Table 16.1

Distance Reduction

- ◆ **Large lots and long production lines with single-purpose machinery are being replaced by smaller flexible cells**
- ◆ **Often U-shaped for shorter paths and improved communication**
- ◆ **Often using group technology concepts**

Increased Flexibility

- ◆ **Cells designed to be rearranged as volume or designs change**
- ◆ **Applicable in office environments as well as production settings**
- ◆ **Facilitates both product and process improvement**

Impact on Employees

- ◆ **Employees may be cross trained for flexibility and efficiency**
- ◆ **Improved communications facilitate the passing on of important information about the process**
- ◆ **With little or no inventory buffer, getting it right the first time is critical**

Reduced Space and Inventory

- ◆ **With reduced space, inventory must be in very small lots**
- ◆ **Units are always moving because there is no storage**

JIT Inventory

Inventory is at the minimum level necessary to keep operations running

JIT Inventory Tactics

Use a pull system to move inventory

Reduce lot sizes

Develop just-in-time delivery systems with suppliers

Deliver directly to point of use

Perform to schedule

Reduce setup time

Use group technology

Table 16.2

Reduce Variability

Figure 16.3

Reduce Variability

Figure 16.3

Reduce Variability

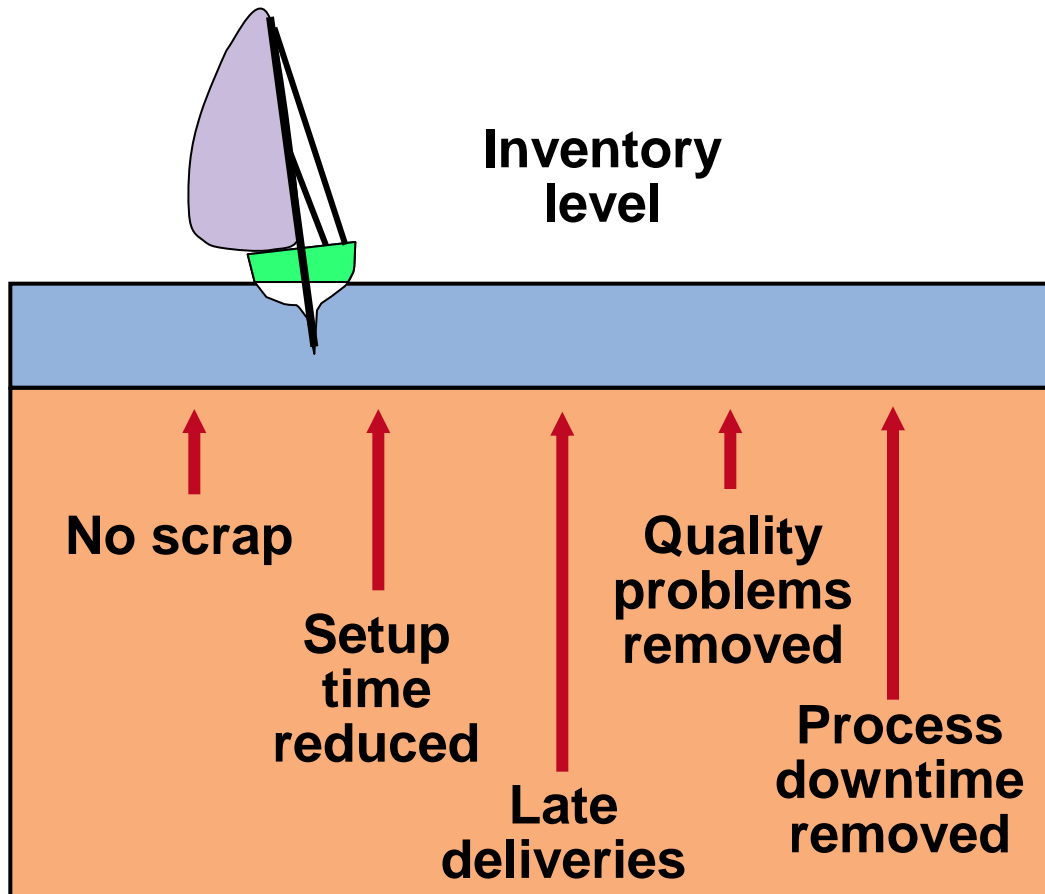

Figure 16.3

Reduce Inventory

- ◆ Reducing inventory uncovers the “rocks”
- ◆ Problems are exposed
- ◆ Ultimately there will be virtually no inventory and no problems
- ◆ Shingo says “Inventory is evil”

Reduce Lot Sizes

Figure 16.4

Reduce Lot Sizes

- ◆ **Ideal situation is to have lot sizes of one pulled from one process to the next**
- ◆ **Often not feasible**
- ◆ **Can use EOQ analysis to calculate desired setup time**
- ◆ **Two key changes necessary**
 - ◆ **Improve material handling**
 - ◆ **Reduce setup time**

Reduce Setup Costs

- ◆ **High setup costs encourage large lot sizes**
- ◆ **Reducing setup costs reduces lot size and reduces average inventory**
- ◆ **Setup time can be reduced through preparation prior to shutdown and changeover**

Lower Setup Costs

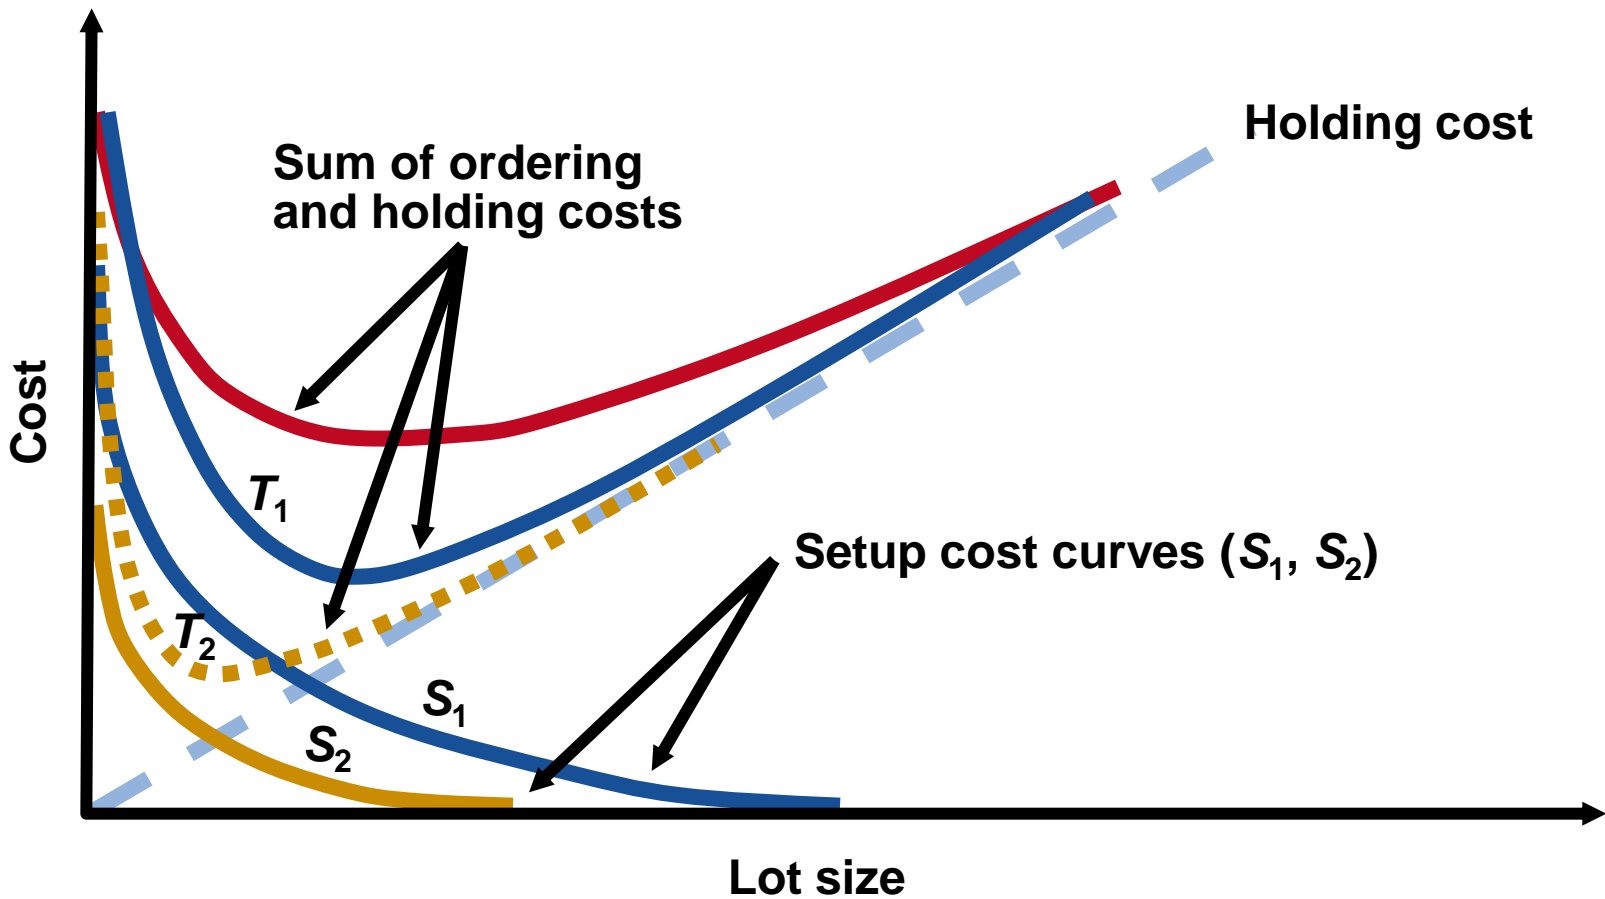

Figure 16.5

Reduce Setup Times

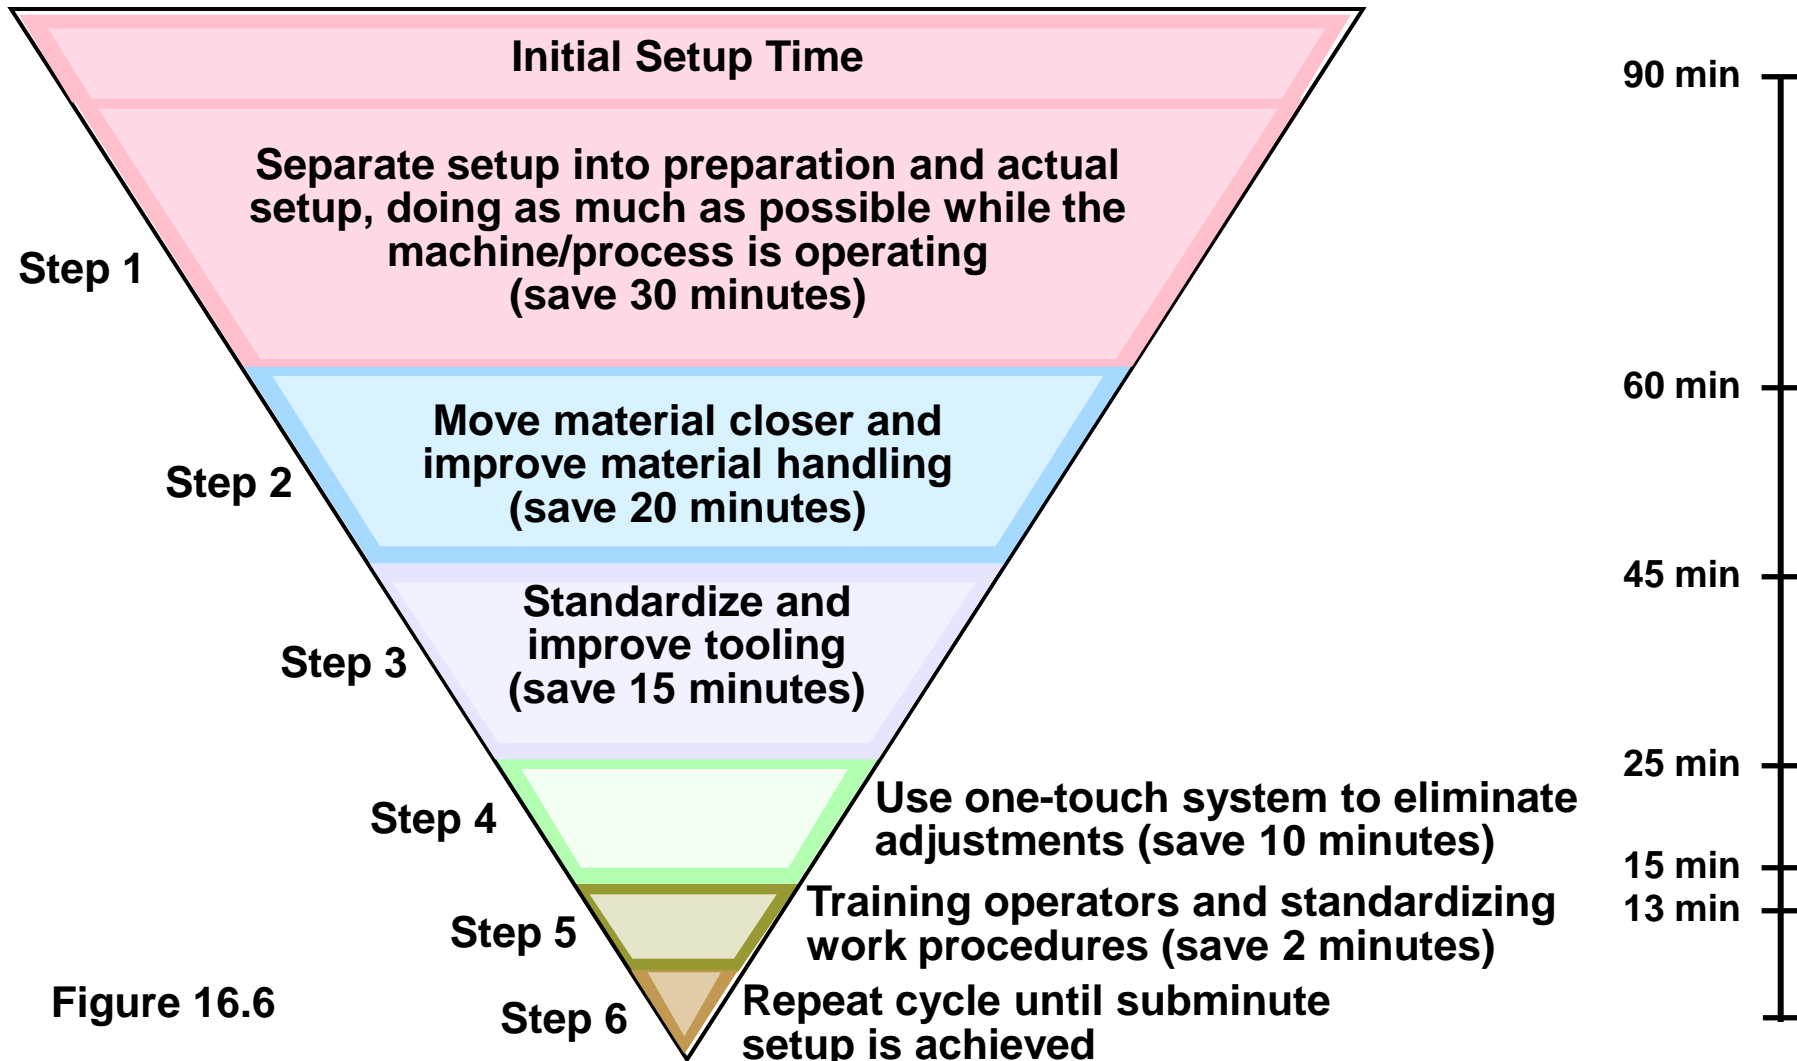

Figure 16.6

JIT Scheduling

- ◆ **Schedules must be communicated inside and outside the organization**
- ◆ **Level schedules**
 - ◆ **Process frequent small batches**
 - ◆ **Freezing the schedule helps stability**
- ◆ **Kanban**
 - ◆ **Signals used in a pull system**

JIT Scheduling

Better scheduling improves performance

JIT Scheduling Tactics

Table 16.3

Communicate schedules to suppliers

Make level schedules

Freeze part of the schedule

Perform to schedule

Seek one-piece-make and one-piece move

Eliminate waste

Produce in small lots

Use kanbans

Make each operation produce a perfect part

Level Schedules

- ◆ **Process frequent small batches rather than a few large batches**
- ◆ **Make and move small lots so the level schedule is economical**
- ◆ **“Jelly bean” scheduling**
- ◆ **Freezing the schedule closest to the due dates can improve performance**

Scheduling Small Lots

JIT Level Material-Use Approach

Large-Lot Approach

Time

Figure 16.7

Kanban

- ◆ **Kanban is the Japanese word for card**
- ◆ **The card is an authorization for the next container of material to be produced**
- ◆ **A sequence of kanbans pulls material through the process**
- ◆ **Many different sorts of signals are used, but the system is still called a kanban**

Diagram of Outbound Stockpoint with Warning-Signal Marker

Kanban

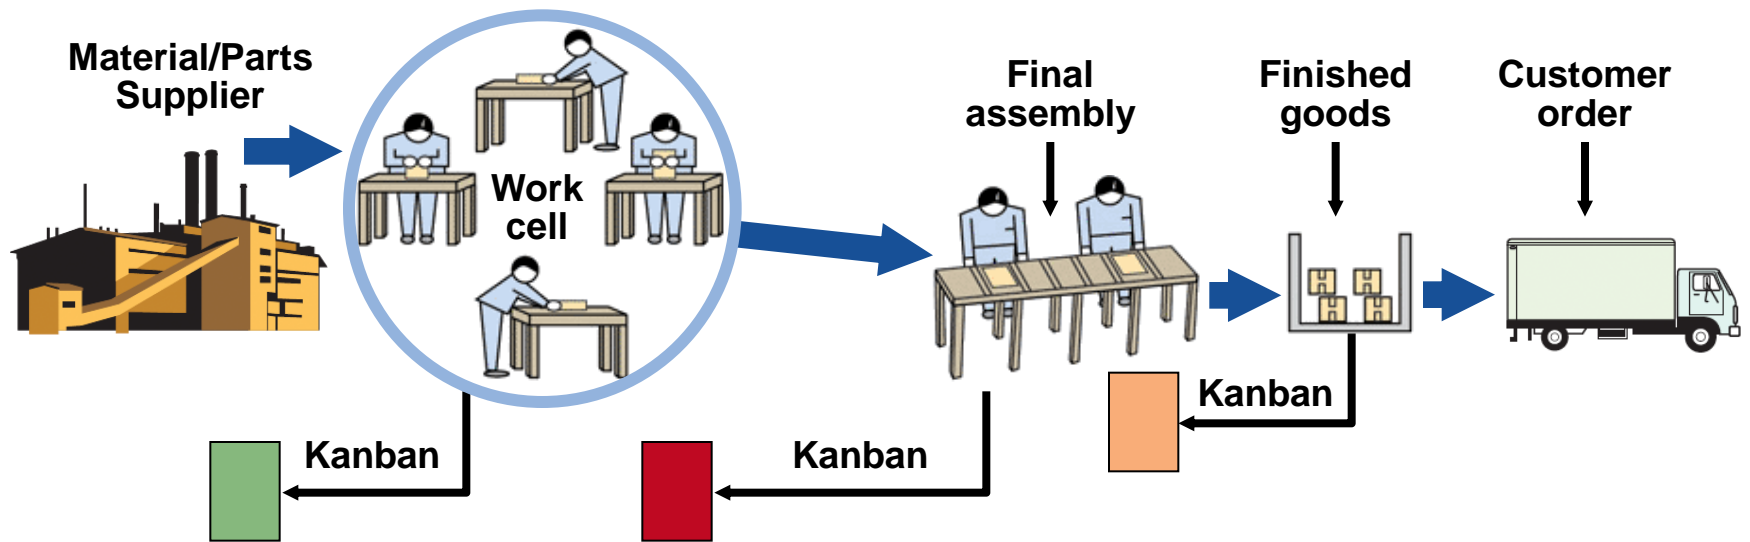

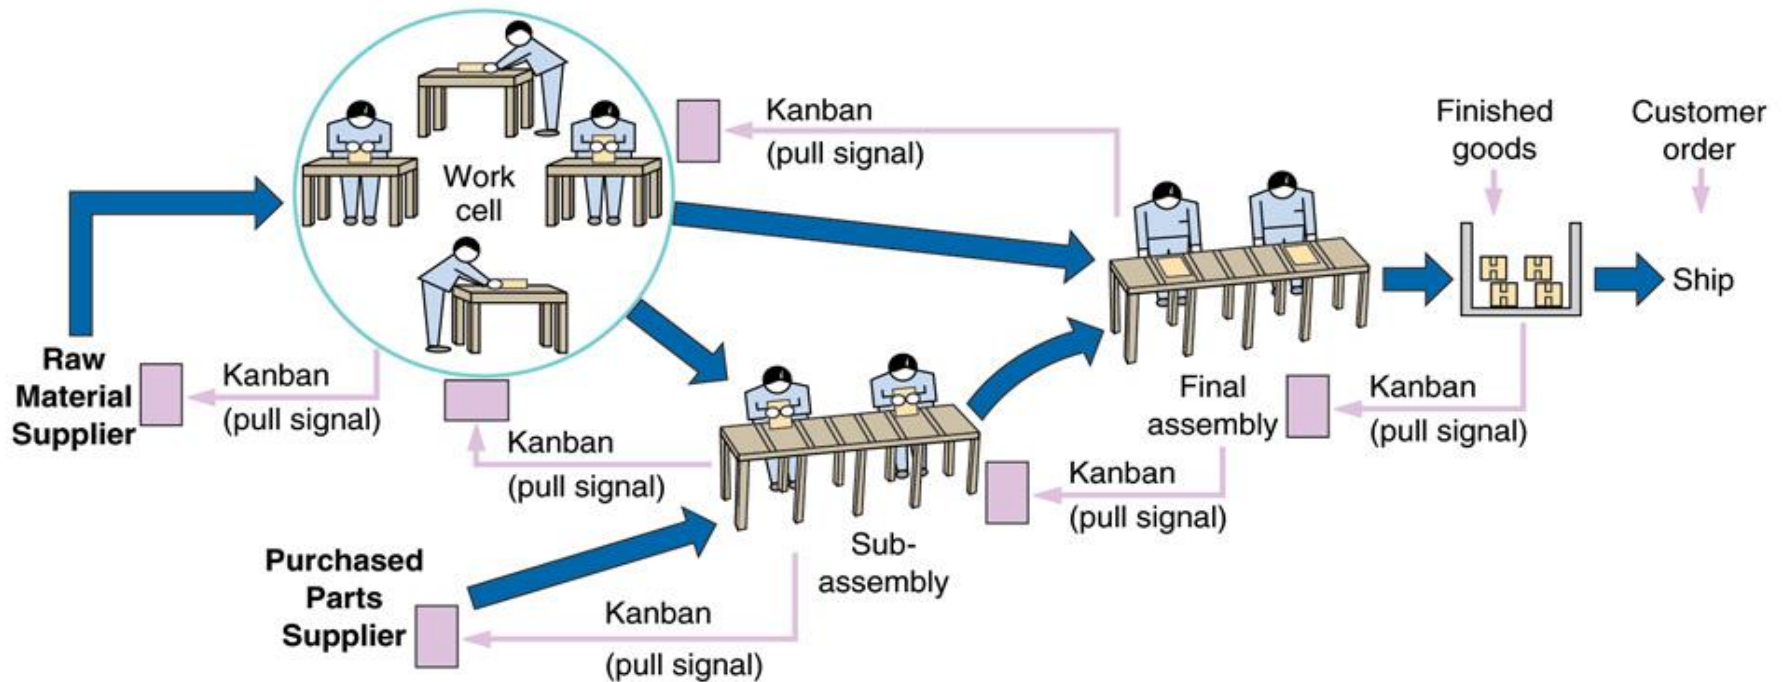

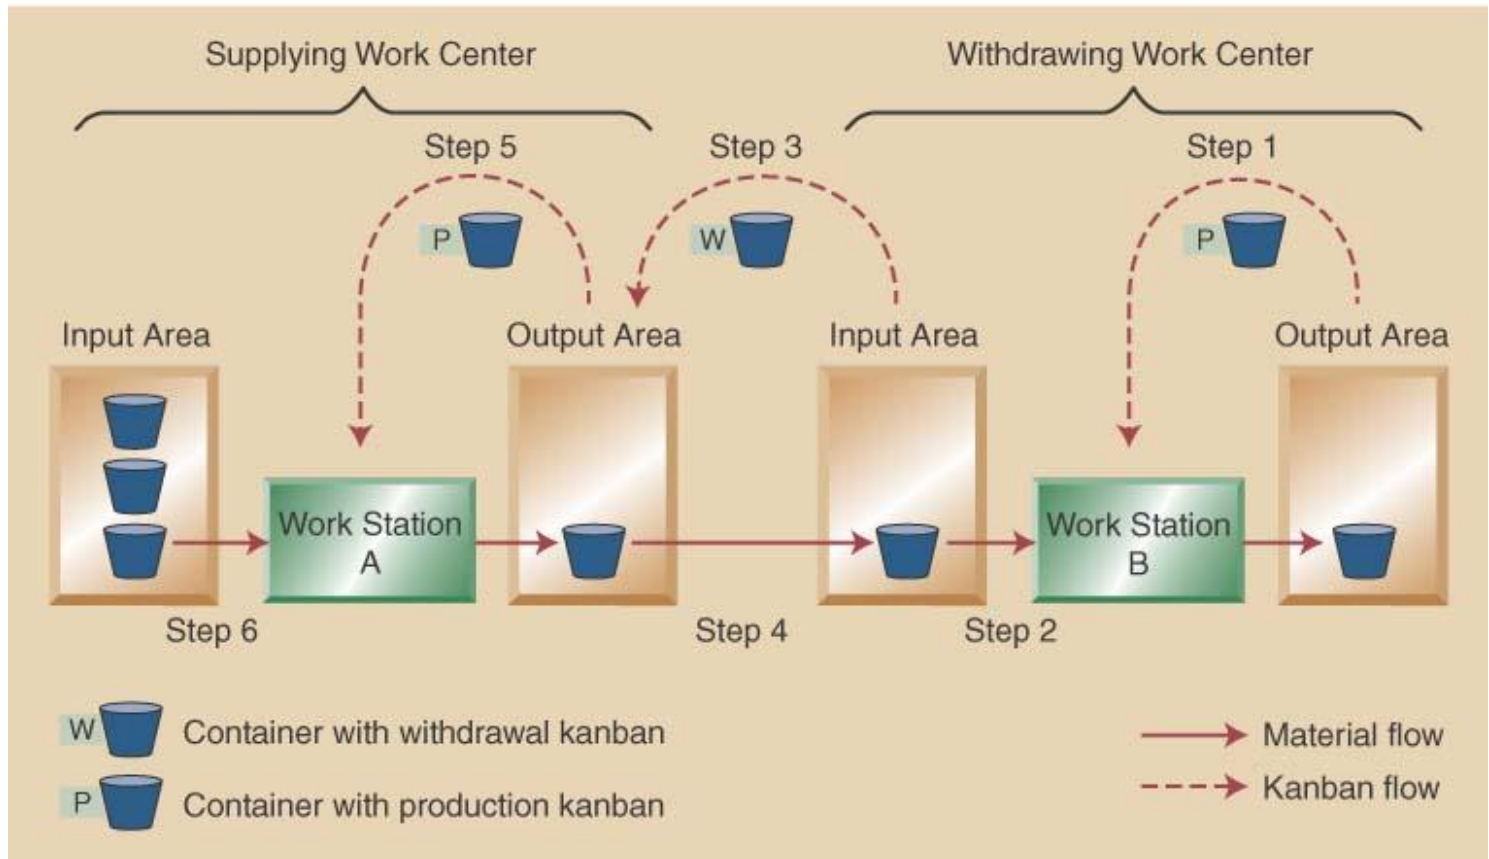

Figure 16.9

Kanban Signals “Pull” Material Through the Process

The Pull System

Number of Kanbans Required

$$N = \frac{DT + S}{C}$$

N = number of containers

D = demand rate at the withdraw station

T = lead time from supply station

C = container size

S = safety stock

Computing the Number of Kanbans: an aspirin manufacturer has converted to JIT manufacturing using kanban containers. They wish to determine the number of containers at the bottle filling operation which fills at a rate of 200 per hour. Each container holds 25 bottles, it takes 30 minutes to receive more bottles, safety stock is 10% of demand during LT.

Solution:

D = 200 bottles per hour

T = 30 minutes = .5 hour

C = 25 bottles per container

S = 0.10(demand)(T) = 0.10(200)(.5) = 10 bottles

$$N = \frac{DT + S}{C} = \frac{(200)(.5) + 10}{25} = 4.4 \text{ kanban containers}$$

Question: round up or down?

JIT Quality

- ◆ **Strong relationship**
 - ◆ **JIT cuts the cost of obtaining good quality because JIT exposes poor quality**
 - ◆ **Because lead times are shorter, quality problems are exposed sooner**
 - ◆ **Better quality means fewer buffers and allows simpler JIT systems to be used**

JIT Quality Tactics

Use statistical process control

Empower employees

Build fail-safe methods (poka-yoke, checklists, etc.)

Expose poor quality with small lot JIT

Provide immediate feedback

Table 16.4

Lean Operations

- ◆ Different from JIT in that it is **externally focused** on the customer
- ◆ Starts with understanding what the customer wants
- ◆ Optimize the entire process from the **customer's** perspective

Building a Lean Organization

- ◆ **Transitioning to a lean system can be difficult**
- ◆ **Lean systems tend to have the following attributes**
 - ◆ **Use JIT techniques**
 - ◆ **Build systems that help employees produce perfect parts**
 - ◆ **Reduce space requirements**

Building a Lean Organization

- ◆ **Develop partnerships with suppliers**
- ◆ **Educate suppliers**
- ◆ **Eliminate all but value-added activities**
- ◆ **Develop employees**
- ◆ **Make jobs challenging**
- ◆ **Build worker flexibility**

Lean Operations in Services

- ◆ **The JIT techniques used in manufacturing are used in services**
 - ◆ **Suppliers**
 - ◆ **Layouts**
 - ◆ **Inventory**
 - ◆ **Scheduling**
